Sustainable Communications Network

Communications for Business Continuity

Persistent Telecom Inc. (PTI) has adapted our Sustainable Communications Network (SCN), developed for the Department of Defense, and are offering the product to companies to bolster the capabilities of existing Business Continuity Plans.

There are two types of BCP requirements:

1. Those related to becoming a member of or receiving certification from an organization (ISO for example)
2. Those related to government regulations within a specific industry designed to provide continuity of service in the event of business disruption.

The purpose of the SCN is to provide situational awareness to key management personnel to preserve the command and control structure of any organization. In the event of business disruption senior management and BCP teams need to come together in order to ensure that informed decisions can be made.

By providing wireless telecommunications services that interoperate over satellite and connect to the Internet and the Public Switched Telephone Network (PSTN), Persistent has created a sustainable communications solution which functions in the most adverse conditions, when traditional communications networks are not available.

Highlights:

- Support any number of designated "priority" subscribers.

- Enable any number of simultaneous voice calls per site.

- Provide SMS text messaging between priority subscribers.

- Provide SMS text messaging to Public Mobile Networks.

- Provide 3G/LTE data connections for email.

- Provide 3G or LTE data connections to the Internet.

- Interoperate with VoIP PBX systems.

- Connection to the PSTN.

Sustainable Communications Network

Communications for Business Continuity

The SCN creates a secure communications bubble for key management personnel and designated members of BCP teams. There are a variety of options including the BCP Football personal flyaway case, antennas for ocean vessels and corporate jets as well as traditional satellite dishes for other corporate locations or private residences.

You can enable voice, SMS and data through the satellite network by the installation of antenna's at corporate HQ, regional or branch offices. The SCN can integrate with existing VPN, VoIP and switched PBX infrastructure. The network includes PTI earth stations to connect to areas where normal services are available.
